

SNAPLIVE OVERVIEW

Image Multicasting Software

The ability to take high resolution photos and multicast them instantly to any user-defined e-mail account is finally here. Using intelligent, power adaptive features and common wireless transmission transport protocols an operator can snap an image and instantly multicast it to anyone without the use of cables or removing the memory card from the camera.

The software monitors Nikon Digital cameras for activity and instantly transfers the image to a local wireless/EVDO/EDGE-enabled laptop which then forwards it securely to any number of authorized recipients.

Perfect for surveillance teams, law enforcement, military personnel, first responders, and the occasional fall on the red Carpet at the Oscars. Real-time Situational Awareness has never been this easy!

Using surveillance grade equipment SnapLive software offers a complete wireless image transfer solution for high resolution photography.

Photos are securely uploaded to the internet as they are taken.

Images are then automatically sent to any user defined e-mail address or personal electronic device within seconds.
